

**Distress Scale** **Comparison: +19**  
 This person's Distress Scale pretest - posttest comparison shows noticeable improvement. This client's posttest Distress Scale score is 19 percent lower than its comparable pretest scale score, which reflects substantial positive change or improvement.

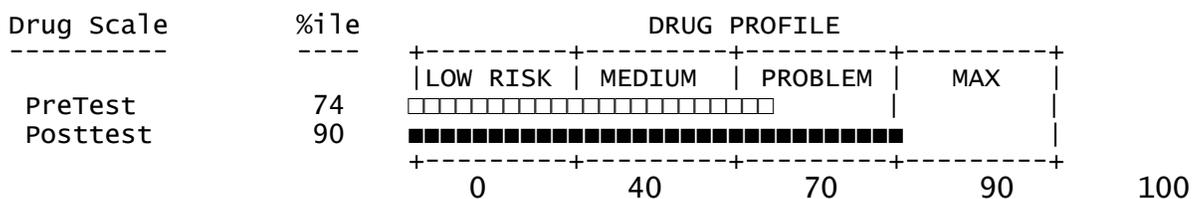

**Self-Esteem Scale** **Comparison: +0**  
 This individual's Self-Esteem pretest - posttest comparison shows little change. This client's pretest and posttest scale scores are within one (+1 or -1) percentage point of each other. If self-esteem was not a treatment plan goal, change would be moot or undetermined.

**Alcohol Scale** **Comparison: +22**  
 This client's Alcohol Scale pretest - posttest comparison reveals improvement. This person's posttest Alcohol Scale score is 22 percent lower than its comparable pretest scale score, which demonstrates positive change. Improvement is impressive and readily apparent.

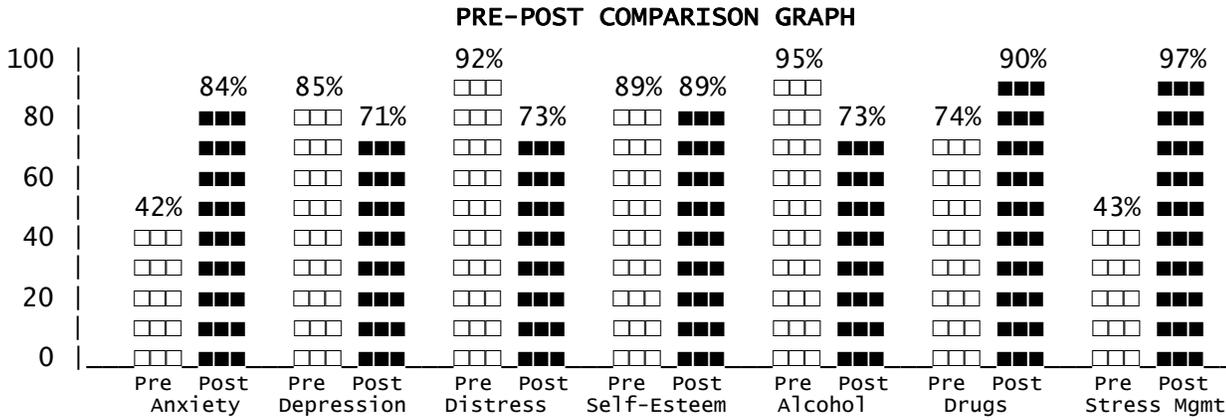

**Drug Scale** **Comparison: -16**  
 This individual's Drug Scale pretest - posttest comparison shows a negative shift. This client's posttest Drug Scale score is 16 percent higher than its comparable pretest scale score, which represents a considerable negative change. Has this client relapsed? Something is wrong.

There are several levels of Pre-Post Inventory scale interpretation when focusing upon analogous scale comparisons. In these instances a test may be viewed as a self-report and attention may be focused upon pretest-posttest scale scores, interpreting analogous scale elevations and understanding scale interrelationships. Overlaying client change can be disconcerting unless attention is judiciously apportioned or divided between client "risk" (pretest) and client "change" (comparison report).

The Pre-Post Inventory Comparison Graph yields a panoramic view of all scale scores and their pre-post comparisons. When a scale's pretest score is higher than its posttest score positive improvement or change occurred. In contrast, when a scale's pretest score is lower than its posttest score negative change has occurred.

**Anomalies & Outliers**

No change or negative pre-post comparison scores could reflect non-treatment. When a patient's treatment plan does not include the problem or disorder represented by an omitted scale, it is likely that such problems/disorders will not be treated. It is recommended that the Pre-Post Inventory be administered as part of treatment intake screening.
